Run A: with UNSURE allowed, the model rarely chose a side on the 2026 events

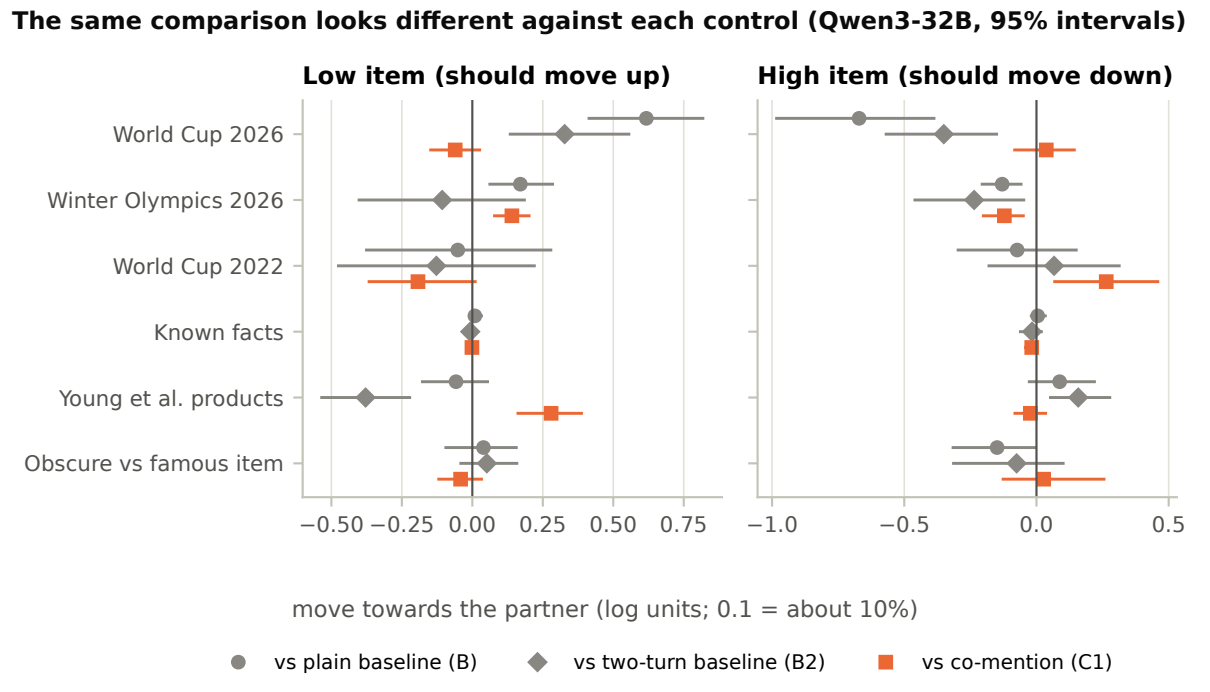

Turn 1 is often a reflex: the model picks the first option it is offered

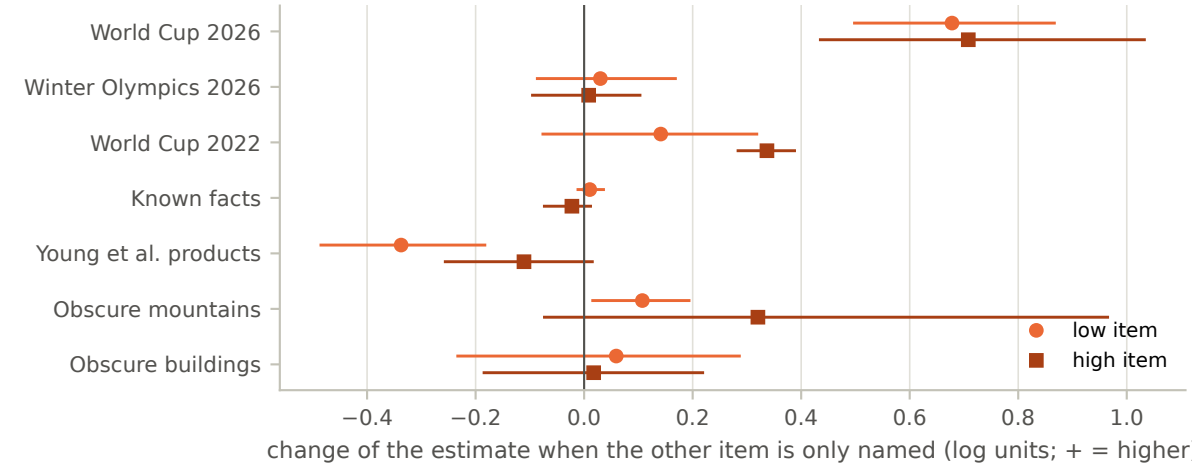

A plain number pulls hardest where the answer is unknown (median over pairs)

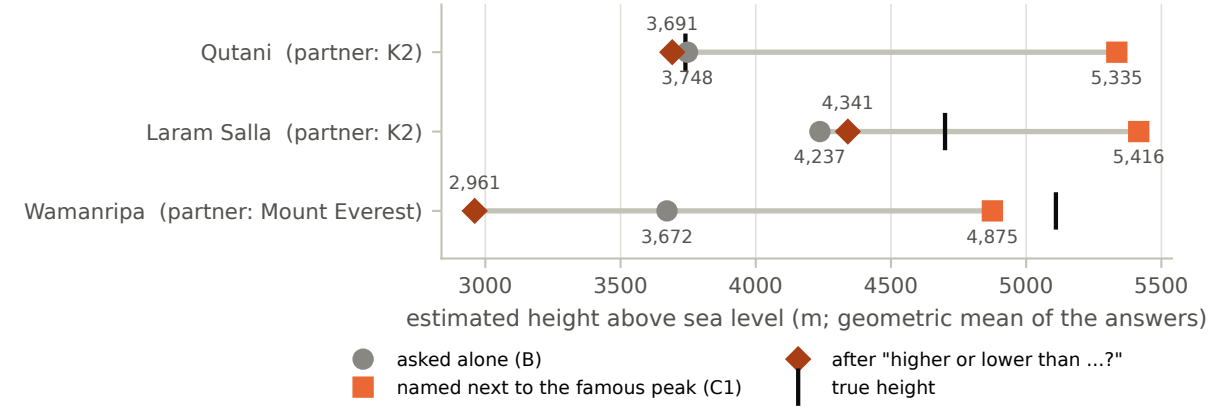

The same comparison looks different against each control (Qwen3-32B, 95% intervals)
Low item (should move up)
High item (should move down)

move towards the partner (log units; 0.1 = about 10%)
vs plain baseline (B)
vs two-turn baseline (B2)
vs co-mention (C1)

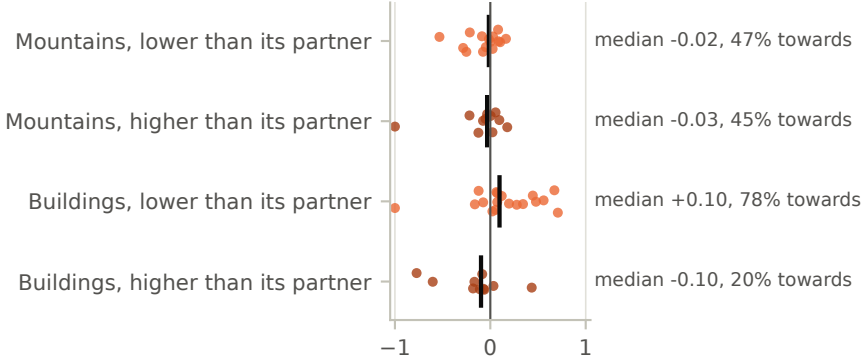

Naming the other item, with no comparison, already moves the estimates

Naming K2 lifts a Bolivian peak; answering the comparison undoes it

Every obscure item: no pull towards the famous partner

Named first, the famous item is almost always called the greater one
